Human adenovirus type 12.
Viruses; dsDNA viruses, no RNA stage; Adenoviridae; Mastadenovirus.
1 (bases 1 to 3498).
Hogenkamp.T. and Esche,H.
Nucleotide sequence of the right 10% of adenovirus type 12 DNA encoding the entire region E4.
Nucleotide Acids Res 18 (10), 3065-3066 (1990).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /product="early E4 13 KD protein"

Nomenclature of proteins has largely followed accepted terminology
of the human adenoviruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /evidence-experimental

Disclosure; Page 37-39; 69pp; French.

This is the sequence corresponding to nucleotides 32749-35935 of the funan adenovirus type 5 (Ad5), which covers the E4 and right inverted than adenovirus type 5 (Ad5), which covers the E4 region of the companies. The E4 region of the edenovirus late genes. The E4 region of the edenovirus late genes. The E4 region is covered to generate cell lines, esp. 293 cells, which can support the compliant of defective recombinant adenoviruses, esp. those that Lack.

Covered to generate cell lines, esp. 293 cells, which can support the condition of defective recombinant adenoviruses, esp. those that Lack.

Covered inserted into their genomes for complementation of the defective region inserted into their genomes for complementation of the defective viruses are esp. mentioned in the specification: they allowed the E4 region and part of the E4 region; virus AVI completelies (nts) 34801-3439 and 34415-33126 consisting of completelies (nts) 34801-3439 and 34415-33126 consisting of completelies (nts) 34801-3439 and 34415-33126 consisting of completelies (nts) 34801-34355 and 444 further lacks the C6 research as nts 33093-33695 and 3463-33555 and AV4 further lacks the completion viruses generated in the new cells can be used for gene completion disorders, virus dystrophy, encodegenerative diseases, chlose defective viruses yer. Growers, dystrophy, encodegenerative diseases, chlose defective viruses yer. Growers (new colls can be used for gene complete also be.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

PT Recombinant adeno-associated virus contg. second gene which recombinant adeno-associated virus stranded to double stranded to facilitates its conversion from single stranded to double stranded to transfer set filters of ex vivo transduction into target cell virus - enhances efficiency of ex vivo transduction into target cell to virus set 108-114; 131pp; English.

Example 19; Page 108-114; 131pp; English.

CC adeno-associated virus (rAAV) which contains 2 genes, the first gene can be to express the gene of interest (beta-qabactosidase) in the target cell; and the second gene of interest (beta-qabactosidase) in the target cell; and the second gene of interest (beta-qabactosidase) in the target cell; and the stended virus to its double stranded form upon expression. The rAAV is stranded virus to its double stranded form upon expression. The rAAV is useful in pharmaceutical compositions for use in ex vivo and in vivo gene converting to the treatment of inherited diseases, cancer and other genetic converting adeno-associated interest and page of a recombinant adeno-associated interest converting the converting converting the converting

Chimpanzee adenovirus vector - useful in gene therapy and genetic rengineering in general

S. Example 4, Pages 89-94; 116pp; English.

C. The sequence is that of plasmid pAV.CMVALP.GRE-ORF6, also called avoirfs, which generates a recombinant adeno-associated virus containing the Lacz transgene and the adenovirus E4 ORF 6.

Sequence 8299 BP; 1816 A; 2130 C; 2108 G; 1963 T;

Adenoviral vectors - which lack DNA encoding for structural protein 'or fibre protein used particularly for gene therapy

Example 1; Pages 131-145; 170pp; English.
The present sequence is that of a pE4/Fiber plasmid used in the method of the invention. The plasmid contains an adenovirus type 5 (AD5) method of the invention. The plasmid contains an adenovirus fiber gene controlled by a CMV promiter, an AD5 E4 gene and an adenovirus type 2 (AD2) tripartite leader sequence upstream of the fiber gene. The invention provides adenoviral vectors having deletions of all or part of
                                                                                                                                                     Complete sequence of the pE4/Fiber plasmid. structural protein; circular; adenovirus type 5; pE4/Fiber plasmid; structural protein; complementation; fiber protein; gene therapy; HTV; tumour; AD5; early gene; Huntington's disease; Tay-Sachs disease; sickie cell disease; E4 regulatory gene; ds.

carly region proteins. Deletions in these proteins would allow a reduced risk of wild-type virus contamination and would allow a packaging of foreign DNA in such vectors for a variety of diagnostic and therapeutic applications. The adenoviral vectors having deletions in the structural and/or early gene regions are produced by cellular complementation of these adenoviral genes. Therefore, the pE4/Fiber plasmid was used as a complementation plasmid which was introduced into plasmid was used as a complementation plasmid which was introduced into a host cell line where parts of the fiber and E4 gene region would be stably inserted into the host cell chromosomes. The resulting E4/fiber vectors can be used for diagnosis or gene therapy, e g. for treating conditions characterised by hyper-proliferative cells (e.g. tumours), sockie cell diseases (e.g. Huntington's disease, Tay-Sachs disease, or sickie cell disease), or infections (e.g. Huy Infection). They can also be used for in vitro production of biologically active proteins.
                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       540

the Ela and E3 regions and comprises asingle packaging signal sequence and Eas and E3 regions and comprise a single packaging signal sequence and the Ela deletion contains at least one Paci, Clai, Xbal Card East one Paci, Clai, Xbal Card East of East one Paci, Clai, Xbal Card StBi cleavage site. The replication deficient viral vectors can be molecules of therapeutic importance, including isoforms of the nitric cystic fibrosis chloride channel (CFTR) gene, the dystrophin gene, the LD receptor gene and the erythropoietin gene. The NOS isoforms can be used in vascular applications or in cancer therapy (microphage NOS), The Cornary artery bypass grafts. A NOS containing adenovirus can also be the concary artery bypass grafts. A NOS containing adenovirus can also be catherosclerotic arteries.

PT MOST cell chromatin in the presence of transposase, providing stable by the durable transgene expression

PS ARMPNE 2; Fig 8A-1; 74pp; English.

This is the DNA sequence of the cis-acting recombinant adenovirus

CC This is the DNA sequence of the cis-acting recombinant adenovirus

CC This is the DNA sequence of the cis-acting recombinant adenovirus

CC This is the DNA sequence of the cis-acting denovirus (see 150558) was also produced, and trans-acting adenovirus (see 160558) was also produced, and retrotransposition and integration viruses. Claimed novel recombinant replication defective viruses of the bost cells was demonstrated in HeLa cells infected with both of viruses. Claimed novel recombinant replication defective viruses (A) comprise: (a) DNA of, or corresponding to, at least part of the virus acquence (ES) comprising a human gene (I) linked to virus geneme, able to infect a mammallan cell; and (b) a first expression sequence (ES) comprising a human gene (I) linked to the cis-acting terminal repeat sequences of a transposon, and ESI express (I) and transfer it to the cellular chromatin in vivo or in recombinant replication defective virus (B) containing a trans-acting express (I) and transfer it to the cellular chromatin in vivo or in recombinant replication defective virus (B) containing a rans-acting recombinant replication defective virus (B) containing a rans-acting and a second expression sequence (ES) containing a trans-acting containing a cells; and containing a mammalian cells which stably express (I) integrated into its conformed with contact of the conformation in the presence of claimed).

CC delivery and stable integration of (I) into a host cell defects or recombinant retroviruses (RW) (claimed).

CC claimed).

CC claimed over an expected defects or recombinan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9271 G;

While Scientific Procession of large foreign DNA fragments, used for, e.g. gene therapy of generic classes(s)

Therapy of generic classes(s)

Disclosure; Page 69-86; 139pp; English

The invention provides improved adenoviral vectors and packaging reliable.

This nucleotide sequence comprises the adenoviral sectors and packaging reliable invention provides improved adenoviral vectors and packaging within the E2b region of the adenoviral genome (see also VO7261).

These E2b-deleted virus are used in conjunction with novel cell ines that constitutively express E2b gene products. The invention species deleted for all viral coding regions. These is sho provides vectors deleted for all viral coding regions. These is both occlis, as demonstrated by the transfer of the dystrophin gene to the muscle of mice. The E2b-deleted and gutted vectors can be provide improved adenoviral vectors useful for a wide variety of gene therapy applications.

nost cell orrowatin in the presence of transposory processing and durable transgene expression

Example 2; Fig 9A-1; 74pp; English.

Example 2; Fig 9A-1; 74pp; English.

Example 2; Fig 9A-1; 74pp; English.

However, a sequence of the trans-acting recombinant adenovirus (see Fig. 020cMvgag-pol. It was obtained by co-transfecting HEK293 (arc CRL1573) cells with linearised plasmid padGMvgag-pol (see Fig. 020cMvgag-pol.) at was obtained by co-transfecting HEK293 and AdSI7001.

Calso produced, and retrotransposition and integration into host cells was demonstrated in HeLa cells infected with both viruses.

Calso produced, and recrotransposition and integration into host cells was demonstrated in HeLa cells infected with both viruses.

Calso produced, and recrosponding to, at least part of the cells was demonstrated in HeLa cells infected with both viruses.

Capression sequences for expression, with the cassette flanked by required for expression sequences for expression, and ESI comprising a human gene (1) linked to required by DNA of (a); (A) can infect a mammalian cell and can capilatory sequences for expression, with the cassette flanked by Capression defective virus (B) containing a transposase (I) and transfer it to the cellular chromatin in vivo or in capped as perplication defective virus (B) containing a trans-acting and a second expression sequence (ES) containing a trans-acting cromatin, produced by infection with (A). (A) and (B) are used contomatin, produced by infection with (A). (A) and (B) are used contomatin, produced by infection with (A). (A) and (B) are used contomating a cellivery and stable integration of (I) into a host cell command a such as cystic fibrosis. (A) and (B) are used contomating terroviruses (RNV) (claimed). (A) and (B) are used contomation at erroviruses (RNV) (claimed). (A) and (B) are used contomation as action as a very produced administration is avoided organ the read of or repeated administration is avoided. The transgene is inherited by the progeny cells and the viral compon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240

Glucocorticoid receptor/adenoviral ORF6 chimaeric fusion gene.
Glucocorticoid receptor/adenoviral ORF6 chimaeric fusion gene.
Human adenovirus; inverted tandem repeat; E4; E1; open reading frame; expression; late gene; cell line; defective recombinant adenovirus; complementation; gene therapy; cystic fibrosis; dystrophy; ds; pcR; neurodegenerative disease; blood coagulation disorder; viral infection; primer; amplification; polymerase chain reaction; fusion protein.
Homo sapiens/Adenovirus Ad5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AGGACAAGGCGCCTTATGCTGCGGGGGGGGGATCATCGCTGAGGAGACCACTGCCATG 33901
